#7	Push-Pull. Transform Dynamic . Merge/Pattern. Remove History Modify Feature. Align it in the vise. Duplicate Solid. Boolean Remove. Move the vise to Level 1000.	

Getting Started

OBJECTIVES

- Starting Mastercam
- The student will learn about the Graphical User Interface.
- The student will learn how to navigate through Mastercam.
- Setting the System Configuration to Imperial.
- Setting the Grid.
- Conventions used in the book.
- Mastercam Workflow.

STEP 1: STARTING MASTERCAM

1.1 For Windows 7

- Select the **Start** button.
- Select All Programs and click on Mastercam 2022.
- 1.2 For Windows 8
 - Select the Start button.
 - Click on the drop down arrow to open Apps.
 - Find and click on Mastercam 2022.

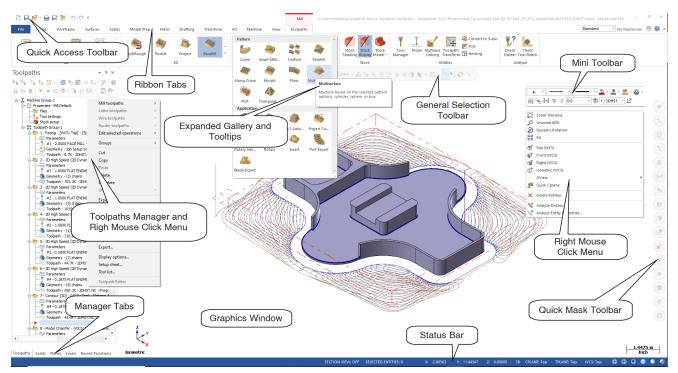

1.3 For Windows 10

- Select the **Start** button.
- Click on the drop down arrow to open Apps.
- Find and click on Mastercam 2022.
- To start the software, from Desktop, click on the shortcut icon as shown.

STEP 2: GUI - GRAPHICAL USER INTERFACE

Quick Access Toolbar	QAT contains a fully customizable set of functions that can be quickly accessed by the user.
Backstage (File)	Allows you to manage files. You can insert information about files, start a new file, open an existing one or merge files together. You can also save, convert or print files as well as access the help resources.
Tabs	Contains all the functionality within Mastercam.
Ribbon	Displays the commands available for a selected Tab.
Selection Bar	Allows you to set the AutoCursor modes and to switch between wireframe or solid selections.
Quick Mask Buttons	Lets you select all entities of a specific type. Clicking on the left side of the button or right side of the button toggles between select all or only.
Right Click Menu	Right click menu allows quick access to functions such as zoom, graphic views or recent functions used. A mini toolbar will also appear that allows you to quickly change the attributes.
Toolpaths/Solids/Planes Manager	Lists the history of the toolpath operations and solids.
Graphics Window	Workspace area in Mastercam where the geometry is displayed.
Scale	Shows you a scale of the object on the screen.
WCS: TOP T/Cplane:	Displays the current WCS and T/Cplane information.

STEP 3: NAVIGATE THROUGH MASTERCAM

In this step, you will learn how to use the menu functions in Mastercam to create geometry.

Start Line Endpoints command

- Select the Wireframe tab (left click).
- Left click on the Line
 Endpoints icon as shown.

File Home	Wireframe Surfaces S	olids Model Prep Mesh
+ + Point Bolt Position + Circle Points	Line Parallel	Circle Center Point Circle Edge Point +

	Line Endpoints	Ψ×
	(?)	300
	Basic	
 Once you select Line Endpoints, the Line Endpoints panel appears on the screen as shown. 	Entity Type: Freeform Tangent Automatically determine Z depth Horizontal Vertical Method: Midpoint Multi-line	۲
	Endpoints 1 2	۲
	Dimensions	۲
	Length: 0.0001	- 🗘 🔒
	Angle: 0.0	- ‡ 🔒
	Axis Offset	٢
	0.0	₹ ‡ 🔒
notion Dromat		

Function Prompt

Prompts the user to execute a command.

Sketching a line

• To sketch a line, left click on two locations on the screen between which the line will be generated.

Creating a line knowing the endpoint coordinates

 To make a line knowing the two endpoint coordinates, select the AutoCursor Fast Point icon from the General Selection toolbar.

- In the coordinates field that opens in the upper left corner enter the coordinates of the first endpoint as shown.
- Press Enter to continue.

Note: Enter the X value then the Y value and if needed the Z value separated by comma (,).

Select the AutoCursor Fast Point icon again and enter in the coordinates of the second endpoint and then press Enter.

Note: You do not need click on the **AutoCursor Fast Point** icon. Once Mastercam promp you to enteran endpoint, you can just start typing the values.

Creating a line knowing an endpoint, the length, and the angle

- You can also enter the coordinates of the first endpoint, then enter the Length and Angle if necessary.
- To continue making lines, choose the **OK and Create New Operation** button from the dialog box or

- To exit the current command, select the OK button or press the Esc button.
- To undo the last command, from the QAT (Quick Access Toolbar) select the Undo button. The Undo button can be used to go back to the beginning of geometry creation or to the last point of the

saved file. Mastercam also has a Redo button for your convenience.

Example: this prompt is used in the Line Endpoints command. Specify the first endpoint

Note: To find a command, from the **Home** ribbon, select the **Command Finder** icon and type the function name in the field that opens up. For example, to find the **Polygon** command, type "polygon" in the text field. From the list, select the desired command.

ommand Finder	×
Polygon	
Polygon - Wireframe/Shapes Create a shape with the specified number of sides and radial va	lue.
Select Polygon - Selection Bar Lock in Polygon Selection	

0,1	 	 	
0,5			

STEP 4: SETTING THE ATTRIBUTES

Mastercam attributes are point style, line style, line thickness, color and levels. Before starting to create geometry, you should set the attributes.

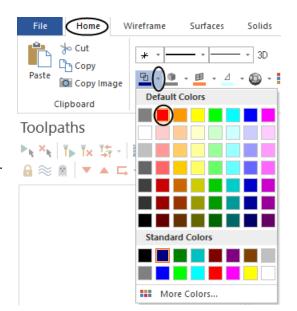

4.1 Attributes Group

Point Style	Displays and sets the system's point style.
Line Style	Displays and sets the system's line style.
Line Width	Displays and sets the current system's line width.
Color	Assigns the current color to wireframe, solid and surface entities. To change the current color, click in the specific color field and select a color from the color palette. To change an existing geometry color, select the geometry first and then click in the color field and select a color from the color palette.
Clear Color	When performing a transform function (Transform), Mastercam creates a temporary group from the originals (red) and a result (purple) from the transformed entities. These system groups appear in the Groups dialog box. However, they stay in effect only until you use the Clear Colors function or perform another transform function.
2D / 3D Construction Mode	Toggles between 2D and 3D construction modes. In 2D mode, all geometry is created parallel to the current Cplane at the current system Z depth. In 3D mode, you can work freely in various Z depths, unconstrained by the current system Z depth and Cplane setting.

4.2 Organize Group

Z Depth	Sets the current construction depth. To set this, click the drop down arrow and pick one from the most recently used list or click the Z: label and pick a point in the graphics window to use the Z depth values based on the selected entity.	
Level	Sets the main level you want to work with in the graphics window. To change the current working level. Type the level number in the box.	

Set the Wireframe Color

- In the Home tab, Attributes group, click on the drop down arrow next to the Wireframe Color field as shown.
- Select the desired color from the dialog box as shown.

Note: Any geometry on your screen will remain in the previous system color. This change will only affect the geometry you create going forward.

To change the color of existing geometry, select the entities first and then click on the drop down arrow next to the Wireframe Color and select the desired color. The same method can be applied for any other attribute that you want to set or change.

STEP 5: ABOUT MANAGER PANELS

5.1 The Toolpaths Manager

The **Toolpaths Manager** displays all the operations for the current part. You can sort, edit, regenerate, verify and post any operation as shown. For more information on the **Toolpaths Manager**, please click on the **Help** icon.

24

- Getting Started
- The Toolpaths Manager, Solids Manager, or Planes Manager can be hidden to gain more space in the graphics area for creating geometry. Use Auto Hide icon to close all Toolpaths, Solids, Planes and Levels Manager panels.

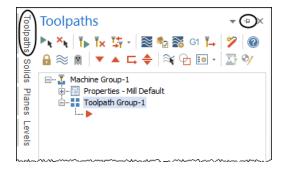

Toolpaths

Solids

Planes Levels Recent Functions

The panels will be hidden to the left of the graphics window as shown or at the bottom of the manager as shown previously.

- To un-hide them, click on one of the managers to open it and then click again on the Auto Hide icon a shown.
- Selecting the X (Close icon) instead of the Auto Hide will close the manager panel.

 To re-open them, from the View tab, select
 Toolpaths, Solids,
 Planes or Levels as shown.

STEP 6: SETTING MASTERCAM TO IMPERIAL

In this step you will learn how to set the imperial system as your default. You will have to select the **Backstage** options and select the system configuration.

6.1 Setting Mastercam to inch for the current session only

Note: You may need to switch Mastercam to run in Inch mode.

File

- Configuration.
 - Select the drop down arrow beside **Current** as shown.
 - Select mcamx.config <Inch> as shown.

Select the OK button to exit the System Configuration dialog box.

Note: If you have open a drawing done in metric on the screen it may ask you to scale the current part to imperial. Choose Yes if you wish to do this.

6.2 Setting Mastercam to Imperial as a default

Note: If you wish to always work in Imperial mode, follow these steps to save Imperial as your current configuration file.

File

- Configuration.
 - Select **Start/Exit** from the configuration topics.
 - Select the drop down arrow below Configuration in the Startup settings area as shown
 - Select mcamx.config <Inch> as shown.

System Configuration	×
Chaining Chain Similar Colors Consuccess Consuccess Default Machines Dimensions and Notes Files On-Screen Controls Post Dialog Defaults Printing Reports Screen Grid View Selection Shading Simulation Solids Spin Controls Controls Default Mastercam Construction plane View Selection Shading Simulation Solids Spin Controls Default Mastercam file name Toolpath Manager Toolpath Manager	Current configuration's units Suppress prompt when switching system units InfigAncamx.config (Inch): (Startup: Metric Add-In programs Startup: None Exit: None Default: FINDOVERLAP.dll Undo Image: Control of Undo events Number of events 100 Not to exceed this size 10

	If you choose 'No', these settings will apply for this session only.	
	Yes No	

STEP 7: SETTING THE GRID

Before beginning to create geometry, it is highly recommended to enable the Grid. The Grid will show you where the origin is and the orientation of the Grid gives you a quick preview of the plane you are working in.

File

- Configuration.
 - Select Screen from the configuration Topics.
 - Select the plus sign (+) beside **Screen** as shown.

System Configuration Analyze CAD Chaining Colors Communications Converters Default Machines Dimensions and Notes Files On-Screen Controls Post Dialog Defaults Printing Reports Screen Grid Viewsheet View Selection Shading Simulation Solids Spin Controls Start / Exit Tolerances Tolerances Tolerances Tolerances Tolerances Tolerances Tolerances Controls Co	*	Spacing X 0.25 Y 0.25 Origin X 0.0 Y 0.0 Y 0.0 Near Near Always Size 1.0
Toolpath Manager Toolpaths	✓ Current:	c:\users\mariana.lendel\document\mcamx.config <inch> <startup> ~</startup></inch>

- In Grid Settings, change the Spacing to X = 0.25 and Y = 0.25.
- Set the Size to 1.0.
- **~** • Choose the OK button to exit.
- Select the **Yes** button to save the settings in the **System Configuration**.
- To see the Grid in the graphics

shown.

CONVENTIONS USED IN THIS BOOK:

We have attempted to make this manual as uncluttered as possible and provide you with reference information when it is appropriate. It is not intended to be a Reference Guide or all-encompassing user manual.

Ĺ

The Text Styles Used Are The Following:

Standard Text - Represents normal wording needed to provide you the instructions.

STEP 8: STEP TITLES

8.1 Sub step titles

Information about the current step, terms or parameter definitions describing the parameters and description.

Bold Text - Represents menu commands, dialog box settings or other similar items from the screen.

Note: Represents information about the process/step that is important or may require an explanation.

Bulleted text are step by step instructions that are to be followed.

The files used in this book are available for download at http://www.emastercam.com/files/.

MASTERCAM® WORKFLOW

The process to create or import the geometry and to generate a toolpath will be repeated over and over through the tutorials in this book. You will find the process simple and straightforward once you have programmed a few parts. The following is an outline of the process we will follow to create programs:

Ľ,

Mill

Lathe

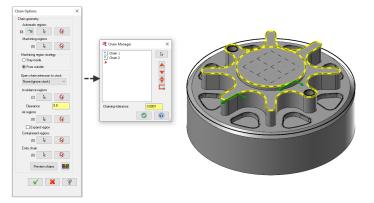

Mill-Turn

Machine Type

- 1. Create or import the part geometry.
- 2. Select the Machine type.
- 3. Define the stock size that your part will be cut from and set tool information.

4. Select a toolpath type such as 2D High Speed Dynamic.

5. Select the geometry of the part you will cut with the different selection options.

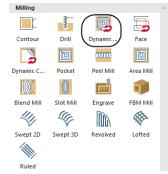

Wire

0.6016 in

Router Design

6. Fill in the necessary information on the parameter pages that appear for the toolpath type you selected.

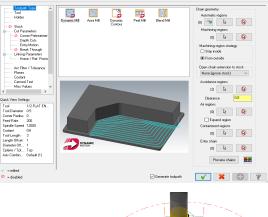

7. Verify the toolpath on your computer screen to confirm the results are as you expected, using Backplot and/or Solid Verify.

8. Make any changes as required by changing parameters.

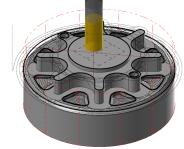

9. If the Generate toolpath is selected in the toolpath parameters, you can skip this step as the toolpath will be automatically updated. Otherwise, Regenerate the "Dirty" operation to update the parameter changes.

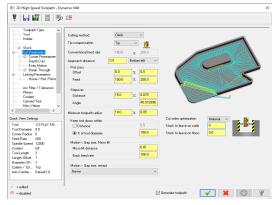

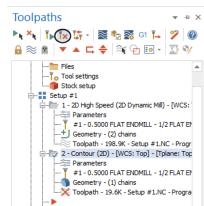

31

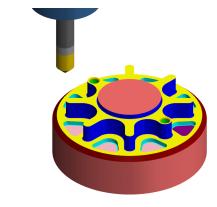

E 2D High Speed Toolpath - D 🎙 🔚 👪 🗏 🕸 🥶

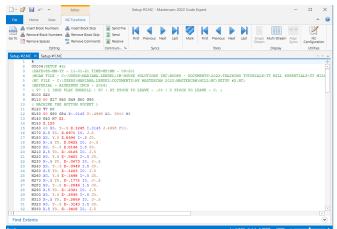

10. Verify again to make sure the toolpath is correct.

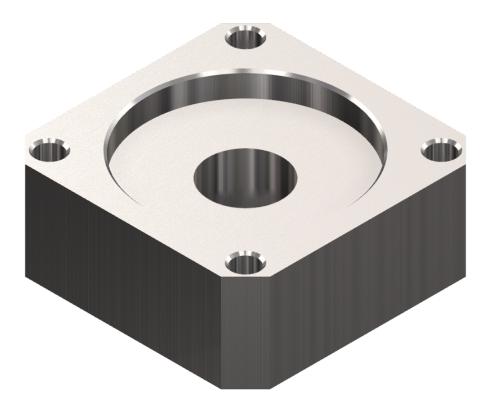

11. Convert the graphical toolpath information into machine code by Post Processing and sending it to the CNC machine.

Note: Mastercam HLE does not support post processing.

Tutorial 1: Geometry Creation

Overview Of Steps Taken To Create The Part Geometry:

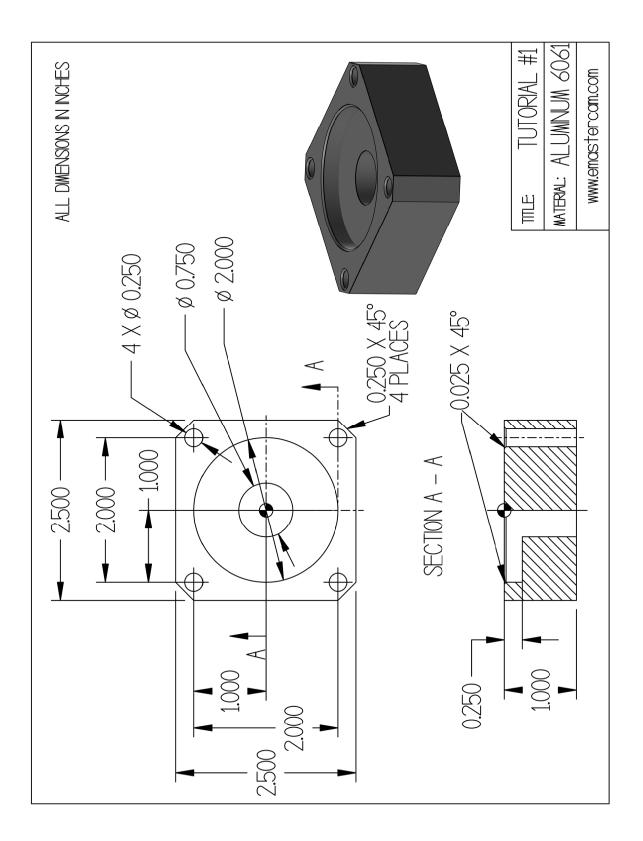

From Drawing to CAD Model:

- The student should examine the drawing on the following page to understand what part is being created in the tutorial.
- From the drawing we can decide how to create the geometry in Mastercam.

Create the 2D CAD Model:

- The student will create the Top 2D geometry needed to create the toolpaths.
- Geometry creation commands such as Rectangle, Circle Center Point, and Chamfer Entities will be used.

TUTORIAL #1 DRAWING

STEP 1: SETTING UP THE GRAPHICAL USER INTERFACE

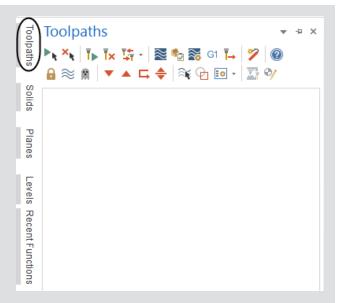

Please refer to the Getting Started section for more info on how to set up the graphical user interface. In this step, you will learn how to hide the manager panels to gain more space in the graphics window.

Use the Auto Hide icon to hide all Manager panels.

• The panels will be hidden to the left of the graphics window as shown.

While creating the geometry, keep the Manager panels hidden. This ensures more space in the graphics window for the geometry.

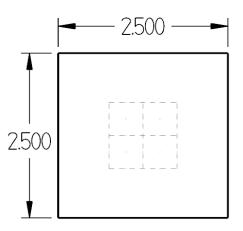

Toolpaths Solids Planes Levels Recent Functions

STEP 2: CREATE ONE RECTANGLE

In this step, you will learn how to create a rectangle given the width, the height, and the anchor position. You will create the 2.5" by 2.5" rectangle with the center anchored to the Origin.

Step Preview:

2.1 Create a 2.5" by 2.5" Rectangle

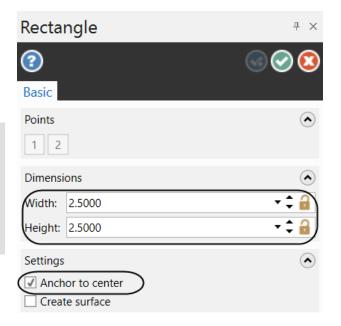

Wireframe

 From the Shapes group, select Rectangle.

File	Home	Wireframe	Surfaces	Solids	Model Prep	Mesh	Drafting	Transform	Art
Point Position *	+ Bolt Circle	+ Line	ne Parallel ne Perpendic ne Closest +	ular C	ircle	Points angent Edge Point	Spline Manual •	Rectangle	A Create Letters
Point	ts	Lin	es		Arcs		Splines		

In the Rectangle panel, enter the Width and Height and enable Anchor to center as shown.

Note: Make sure that **Create surface** is not selected. **Anchor to center** sets the base point of the rectangle to its center and draws the rectangle outward from the center. **Create surface** creates a surface inside of the rectangle. Surface creation and Surface toolpath are covered in Mill Advanced.

38

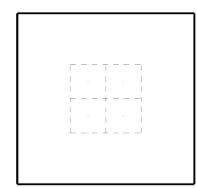

Select the position of the base point as shown.

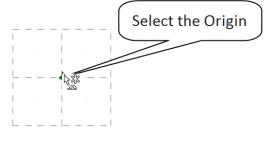

• A preview of the geometry should look as shown.

Note: The geometry should appear in cyan blue color which is the color for live entities. While the rectangle is live, you can adjust the dimensions or select a new base point.

- Select the **OK** button to exit the **Rectangle** command.
- The geometry should look as shown.

Note: While creating geometry for this tutorial, if you make a mistake, you can undo the last step using the **Undo** icon. You can undo as many steps as needed. If you delete or undo a step by mistake, just use the **Redo** icon. To delete unwanted geometry, select the geometry first and then press **Delete** from the keyboard. To zoom or un-zoom, move the cursor in the center of the geometry and scroll up or down the mouse wheel.

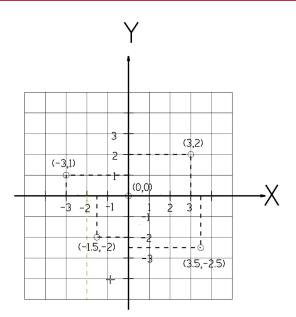

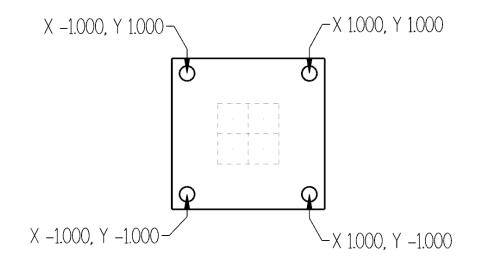

STEP 3: CREATE THE 1/4" DIAMETER CIRCLES

In this step, you will create circles for which you know the diameter and the locations. To use **Circle Center Point**, you need to know the center point and the radius or the diameter of the circle. To complete this step, you will need to know the **Cartesian Coordinate System**. A **Cartesian Coordinate System** is a coordinate system that specifies each point uniquely in a plane by a pair of numerical coordinates, which are the signed distances from the point to two fixed perpendicular directed lines, measured in the same unit of length as shown.

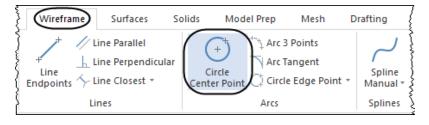

Step Preview:

Wireframe

 From the Arcs group, select Circle Center Point.

Circle Center Point	т ×
?	iii 📀 💿
Basic	
Entity	۲
Method: Manual Tangent	
Center Point Reselect	۲
Size	۲
Radius: 0.125	- ↓ 🔒
Diameter: 0.25	• \$ @
Settings	۲
Create surface	

- Enter a **Diameter** of **0.25** in the panel as shown.
- To create all four circles, click on the lock icon to lock the value.

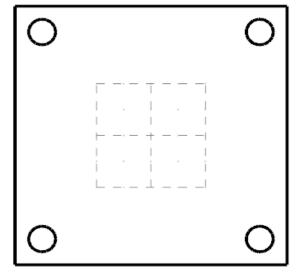

- [Enter the center point]: Select the AutoCursor
 Fast Point icon from the General Selection toolbar and the field where you can type the coordinates will open at the upper left side of the graphics window as shown.
- Type 1, 1 as shown.

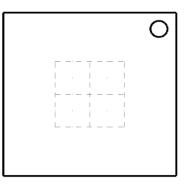

Note: When entering the coordinates for the center point, the first value is the X coordinate value, then the Y value followed by the Z value only if it is different from zero. The coordinate values are separated with commas. You do not need to use the coordinate labels if you enter the values in this order.

1.1

- Press Enter and the circle will be placed as shown.
- [Enter the center point]: Select the AutoCursor Fast Point icon again and enter 1, -1.
- Press Enter to place the circle.
- [Enter the center point]: Select the AutoCursor Fast Point icon again and enter -1, 1.
- Press Enter to place the circle.
- [Enter the center point]: Select the AutoCursor Fast Point icon again and enter -1, -1.
- Press Enter to place the circle.
- Once complete choose the **OK** button to exit the command.

The geometry should look as shown.

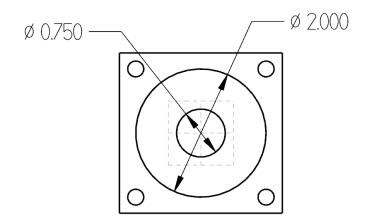

STEP 4: CREATE THE 3/4" & 2.0" DIAMETER CIRCLES

In this step, you will use the same **Circle Center Point** command to create circles for which you know the diameters and the locations.

Step Preview:

Wireframe

 From Arcs group, select Circle Center Point.

Wireframe	Surfaces	Solids	Model Prep	Mesh [Drafting
	ine Parallel ine Perpendicul ine Closest 🔻		+ ircle er Point	angent	Spline Manual *
Lir	nes		Arcs		Splines

Diameter: 0.75

Settings

Circle Center Point Ψ× ? (\checkmark) Basic Entity ۲ Method: Manual ○ Tangent Center Point • Reselect Size ~ 0.375 Radius: - ‡ 🔒

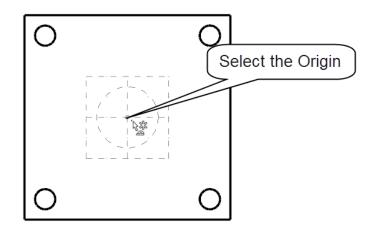

• Enter the **Diameter 0.75** in the panel and disable the lock icon as shown.

2022

42

•

- [Enter the center point]: Move the cursor to the center of the rectangle until the cursor cue tip changes to the Origin as shown.
- Click to select the Origin.

- Press Enter to see the circle preview.
- Press Enter again to finish the circle.

Note: While the circle is live, cyan color, the circle diameter and its location can be modified. To avoid this, you need to press **Enter** to finish the circle.

- In the Diameter field of the Circle Center Point panel, type 2.0 and press Enter.
- The panel should look as shown.

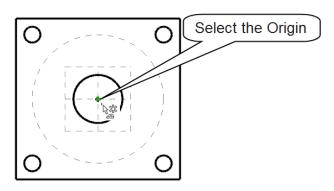

Circle Center Point	Ψ×
Basic	000
Entity Method:	۲
Center Point Reselect	۲
Size Radius: 1.0 Diameter: 2.0	•
Settings	٢

 [Enter the center point]: Select the Origin as shown.

Note: Because the center of the 0.75" diameter circle is in the Origin, you could also select the point when the cursor center cue tip appears as shown.

• Once complete, choose the **OK** button to exit the command.

• The geometry should look as shown.

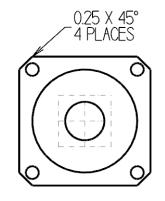

STEP 5: CREATE THE CHAMFERS

In this step, you will create 45 degree chamfers at the corners of the rectangle. You will use the **Chamfer** Entities command.

Step Preview:

Wireframe

• From the **Modify** group, select Chamfer Entities.

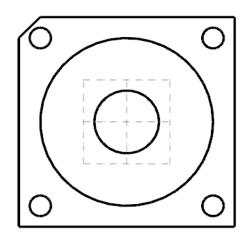

Curve All Curve Slice One Edge Edges by Plane * Curves	Trim to Break Two Entities * Pieces * Modify Length	Fillet Entities * Entities * Modify
--	--	---

	Chamfer Entities	中 ()
